### monthly temperature

#### Further Information:

After a very warm and dry spring, the hops are at a normal growing stage, healthy and growing well. The now wet and cold weather will inhibit the growth of the hop plants.

Training of the hop shoots started very early due to the warm weather and was completed at the end of April respectively beginning of May.

Phytosanitary measures to control the peronospora primary infection have already been carried out and will be completed after training is done.
