daily temperature in July 2018

monthly temperature

monthly rainfalls

Further Information:

July was too warm and too dry. The increasing water deficit in combination with very hot temperatures will affect crop quantity and alpha acids of the early aroma varieties. Late-ripening varieties (especially Herkules) still look good, but urgently need enough rain.

In many cases control of aphids and spider mites is difficult. Fungal diseases are not relevant. Harvest will start some days earlier.
